OVERVIEW

CONTENT OF THE MANUAL

TERMINOLOGY
Terms, units and abbreviations used in this manual.

INTRODUCTION
This part introduces you to the elements of the Electro Magnetic Speed Log (EML) system.

CHAPTER 1 – PHYSICAL INSTALLATION
Correct installation of the system will ensure problem free service for many years. This section explains the main steps to get your system working.

CHAPTER 2 – SETTING UP THE COMPACT DISPLAY
The Compact Display is a flexible, yet intuitive display allowing data to be displayed in a user friendly way. It is also a primary system and can be integrated into the navigation system as required by the regulations. This chapter explains how to set up the unit.

CHAPTER 3 – CALIBRATION
Each new installation is unique and the system must be matched to the vessel. Calibration is required to ensure mounting errors and that hydrodynamics of the vessel are compensated for. This chapter explains the procedure in a step by step guide.

CHAPTER 4 – ROUTINE OPERATION
Once the system is installed and operational, the user can change the screen to show the data of interest at any particular time. This section explains the basic operation of the system.

CHAPTER 5 – CHECKING YOUR SYSTEM
It is a good idea to verify your systems performance from time to time. This chapter describes how to check interfaces and other issues. In the event of malfunctional, this is a good place to start for trouble shooting.
CHAPTER 6 – MAINTENANCE

To keep your EML 224 Compact system in order, regular maintenance is important. To take advantages of new features and performance enhancements, you may need to update software. This section shows how how.

APPENDIX 1 – BACKGROUND INFORMATION

Here you will find more details of how the system works and which factors are important to know when using it.

APPENDIX 2 – MECHANICAL DRAWINGS

A picture is worth more than 1000 words! In addition to the text describing installation, the mechanical drawings are included to allow correct installation.

APPENDIX 3 – OUTPUT FORMATS

The system uses primarily NMEA 0183 standard. This section describes the format of the messages used. It also describes the other digital signals in use.

APPENDIX 4 - SENDING THE SYSTEM FOR REPAIR

In the unfortunate case of a failure that requires a factory repair, the return sequence described, should be followed.

APPENDIX 5 - OTHER OPTIONS WITH THE COMPACT DISPLAY

The EML Compact can be used in a number of different systems both as a repeater and a speed log. This section explains what is available and how to activate the options. The EML Compact also contains a diagnostics port, from which the user can obtain diagnostic information using hyperterm. This is described here.

APPENDIX 6 - SUPPORT SOFTWARE/RELEASE NOTES

The Compact display is alphanumeric and as such, is restricted in the amount of information it can display. SKIPPER Electronics AS is continuously developing support tools to ease use of its products. The Compact system allows for the user to extract additional information about the systems condition. This appendix describes the software tools available that will aid this process.

TERMS USED IN THIS MANUAL

UNITs
Unless otherwise stated, all values shown on the display are as follows:

<table>
<thead>
<tr>
<th>Measurement</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distance</td>
<td>Nautical miles (nm)</td>
</tr>
<tr>
<td>Speed</td>
<td>Nautical miles per hour (kn)</td>
</tr>
<tr>
<td>Pulse indication</td>
<td>Pulses per nautical mile (p/nm)</td>
</tr>
<tr>
<td>Temperature</td>
<td>Degrees Celsius (°C)</td>
</tr>
</tbody>
</table>

ABBREVIATIONS
In addition, the following symbols are used on the runtime screens:

<table>
<thead>
<tr>
<th>Abbreviation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tp</td>
<td>Daily trip (in nm)</td>
</tr>
<tr>
<td>TL</td>
<td>Total measured distance travelled</td>

</tr>
</tbody>
</table>
INTRODUCTION

THE EML SPEED LOG

The SKIPPER EML 224 Compact is a device that uses the effects of magnetism in moving water to measure the speed of a vessel in one or two axis. This effect is well understood and provides reliable data of the speed of the vessel through the water. This information is normally not available from any other sensor on board, and gives the navigator valuable information as to how currents are effecting the motion of the vessel. The EML system comprises of four main parts:

1. **The mounting**; Either a Sea Valve or tank. Welded to the bottom of the hull.
2. **The sensor**; A speed sensor device designed to fit into the mountings.
3. **The Electronic unit (JB60CD)**; The JB60CD allowing the EML 224 Compact to be powered and interfaced to the other navigation systems using digital standards.
4. **The EML 224 Compact display**; An alphanumeric display unit allowing the bridge staff to view the data.

The EML 224 Compact is unique in its simple, yet flexible way to display vital data in almost all conditions.
interConnection diagram

- 4×2 twisted pair, recommended specification:
  - 0.5 sq mm, AWG 20
  - 1.0 sq mm, AWG 18
  - 2.5 sq mm, AWG 13

- Junction Box: min. 16 terminals
- Yacht supply
- Ball Valve
- Tank

Electronic Unit
- J80CD
- 24-36V DC
- 110-240V AC

- Bridge: 60 m
- Compact Display: 30 m
- Compass Safe Distance: 30 m

- NMEA 2 (IEC 61162-1)
- Alarm: BY 2
- Dimming
- Pulse: Power/Alarm

*) Specification limitation (voltage for 24 V is supplied by JB0CD), the Junction Box should have at least 21 V. It is acceptable to parallel pairs on the power to improve system, thereby reducing the voltage drop.
Installation usually takes place in two/three phases:

1. Mounting of the hull metalwork
2. Cabling and mounting of the electronics and sensor
3. Initialisation and calibration of the system

MOUNTING THE HULL METALWORK
This must happen in dock and care should be taken to mount the valve/tank such that the sensor will be flush with nothing to cause turbulence near the sensor. The sensor should be mounted forward in the vessel, preferably just behind the bulb.

Important: Tank mountings have an orientation (an arrow that must point forward).

The sensor, is fully water tight and can be mounted in wet areas such as ballast tanks. Please see the separate mounting user guide for more details.
MOUNTING THE SENSOR

Sensor Location.
For proper operation, the sensor should be installed close to the bulb or the stem of the ship, avoiding areas where it may be damaged by the anchor chain. It is, of course, necessary to select a part of the hull that is submerged under all load and speed conditions.

The JB60CD unit has to be installed in a dry place on the bridge.

The Sea Valve with sensor can be installed in a water tank, but it is not recommended. It is necessary to position the sensor on a flat, horizontal hull section which is large enough to ensure a laminar water flow for all angles of drift. If such a flat section is not available, the shipyard must construct a suitable bed. If the vessel is designed with a box keel, this can be used for installation of the sensor. In this case, special length hull fitting and sensor may be ordered from SKIPPER.

Before hull fitting installation procedure is initiated, always check that the hull fitting valve can be properly operated and that the sensor can be removed in the location selected. See installation manual for the valve solution for more information.

PART POSITIONING AND WELDING
Please see the installation manual for the valve. Installation may differ between the different valve solutions available.

RECOMMENDED ELECTRODES

<table>
<thead>
<tr>
<th>Material</th>
<th>Electrode Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steel hull:</td>
<td>Type SAF 24, 12 or equivalent</td>
</tr>
<tr>
<td>Aluminium hull:</td>
<td>Filler metal = AG4 or AG4 MC</td>
</tr>
</tbody>
</table>

WELDING PRECAUTIONS

Separate the bottom flange from the remaining hull fitting assembly before welding. Use a board to ensure that the bottom flange is flush with the external surface of the hull. Before welding, remove the O-rings. Remember to apply grease when refitting them. After welding, check that the outer weld filling has been properly grounded down. Paint the hull fitting as well as the hull itself with a suitable anti-corrosion/anti-fouling product, but do not paint the protruding part of the sensor and electrodes.
TRANSDUCER INSTALLATION

Please see the installation manual for the valve. Installation may differ between the different valve solutions available.

The sensor can be mounted and powered in air and water. Briskly rubbing the pins of the sensor will show changes in values in the speed. It is very important that the sensor is mounted in the correct orientation, (especially single axis units). In a tank, the arrows should point forward. On a ball valve, the flat area should point port.

Tip: Placing a large flat straight pole on the flat area will allow accurate adjustment. Alternatively a laser level can be used to get accurate orientation on a remote bulkhead.

Small errors in angle can be calibrated in the 2 axis version, but care should be taken to get this as accurate as possible. Each time the sensor is lifted or repositioned, the angular offset should be checked.

CABLING

System elements should be placed as in the diagram on page 13 and 43. The EML sensor is supplied with 40 m of cable. This should be guided to a dry area where a junction box (Yard supply or SKIPPER part nr. ZZL-01020) should be used to extend the cable to the bridge. The EML sensor is a smart sensor and outputs propriety NMEA messages. This standard is based on RS-422, so cable lengths should not be a problem. However, power is sent down
the cable and the sensor should have at least 21 V at the sensor junctions box to function normally. If the voltage (under use) is less than 21 V, the yellow/orange pair (J200 pin 7-8) can be removed/disconnected in the junction box and Electronic Unit, and the pair used to double up the power (J200 pin 1-2). The cable should be as follows:

<table>
<thead>
<tr>
<th>Distance (m)</th>
<th>Cable Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 40 m</td>
<td>Use supplied cable</td>
</tr>
<tr>
<td>Up to 100 m</td>
<td>4 twisted pairs min 0.5 mm²</td>
</tr>
<tr>
<td>Up to 300 m</td>
<td>4 twisted screen pairs 1.5 mm²</td>
</tr>
<tr>
<td>Up to 600 m</td>
<td>4 twisted screen pairs 2.5 mm²</td>
</tr>
<tr>
<td>Over 600 m</td>
<td>Local 24 V supply to sensor at junction box is recommended</td>
</tr>
</tbody>
</table>

Although the signals on the cable are digital, it is recommended to avoid electrically noisy areas such as pneumatics and generators.

The JB60CD Electronic unit is mounted on the bridge. The EML 224 Compact display is supplied with 10 m of cable which can be extended to max. 20 m. This cable is connected to the JB60CD box connector J300. The sensor cable is connected to the JB60CD box connector J200. External inputs and outputs are connected to the connectors J301 and J400 as shown in diagram on page 46-47.

**POWER**

Power to the Electronic Unit (JB60CD) supplies power to the whole system. The user has the option to use either or both AC 110-240 V, or DC 20-36 V supplies. Both can be connected at the same time. The JB60CD has automatic fuses which, if tripped, will reset when the fault is removed.

**THE DIGITAL INPUTS AND OUTPUTS (ALARM, PULSE, DIMMING)**

The digital inputs and outputs of the system meet the standard requirements for IEC 61162-1. Inputs and pulse outputs are optoisolated as shown on page 19. To make these work, it is necessary to apply a voltage and a resistance in series to the pin marked with name followed by ‘A’, as shown. The nature of this type of connection is such that the installation requires an external voltage (4-30 V) to function. A positive voltage is required on pin marked ‘A’. GND or negative on pin ‘B’. Alarm output uses a standard relay are COM (8), NO (9), NC (10), on J400.
THE PULSE OUTPUT
A single pulse output is available. This pulses at a rate proportional to the longitudinal speed. (This is the required output for RADAR systems). The pulse is active high, and the pulse length is 60 ms. This output is located on pin 9 and 10 on connector J301 and is attached to an optocoupler. To get a signal from this port, a voltage must be applied to PLS1A (4-30 V). (The same as fit-out).

THE DIMMING INPUTS
Pulses of at least 60 ms on the dimming up and dimming down inputs (J400 pins 5, 6, 7) will cause the dimming to change by one level. The inputs are optocoupled and therefore require an external voltage to operate, (4 Volt -30 Volt (typically 12/24 Volt)).
Typical NMEA 0183 Input
Galvanically separated.

Revision 2.30 (1998):
Max Load Current = 2 mA at 2 V

Revision 1.9 (1985):
Must withstand ± 15 V

Typical NMEA 0183 Output
Revision 2.30 (1998):
RS-422 Signal levels and Drive Capabilities.
Balanced Outputs 0 - 5 V nominal.
Balanced Outputs 0 - 3.5 V @ 30 mA.
Output current 30 mA.

Revision 1.9 (1985):
Must withstand ± 15 V

Typical NMEA 0183 Connection Methods

CHAPTER 2

SETTING UP THE COMPACT DISPLAY

PRINCIPLES
The EML 224 Compact display is a flexible dot matrix LED display designed to display navigation data. The display can be user programmed to show most kinds of numerical data, from NMEA messages or self generated. It can also be used as a primary sensor display for speed logs showing the speed values produced by the sensor, or as a simple repeater. The EML 224 Compact with its electronic unit (JB60CD) meets all the requirements of a primary device, both functionally and electrically. On its own, it meets the requirements as a repeater. The EML 224 Compact has three user definable alphanumeric displays, each allowing up to 4 parameters to be displayed. When the device is used as a primary device, some of these screens will be fixed.

RUN SCREENS
The unit starts up in run mode. By pressing MENU button, the preset user screens can be selected. Some of the menu screens (i.e alarms) are also available in the run mode. The unit can be dimmed in any of the run screens using the up (↑) and down (↓) buttons. If Trip/Total are selected as a displayed parameter, they can be toggled using the SET button. More information in chapter 4 (Routine Information).

MENU SCREENS
To change the setup of the EML 224 Compact, the user must simultaneously press MENU and SET. This will give access to a menu system allowing the user to scroll up and down the sub-menus and functions using up (↑) and down (↓), and SET to select. To move to the previous menu, the MENU button must be pressed. The middle underlined line is the selected line, the other lines are dimmed.

ACTIVATING THE RUNTIME DISPLAYS
The system has three user definable screens. Screen 1 may be locked in some configurations. In addition, the user can make the most common setup screens
available. The screen menu allows the user to choose which runtime screen to include. Using the SET button, the user can enable or disable each individual screen. Up (↑) and down (↓) will scroll to the next available screens.

CONFIGURING OF DATA SCREENS

The three user programmable screens can be set up using the configuration (CONFG) menu. This submenu allows the user to select one of the three displays. On entering the CONFG screen, the user can change the data type to be displayed in each of the 4 screen positions. Up (↑) and down (↓) will change the data type, SET will move to the next screen position. The screen layout will depend on the selected data type. Up to 4 lines of text and data can be displayed on each screen.

Placing TXT in the bottom 4th line or 3rd and 4th line will cause the data to spread out showing fewer data points. The system will not allow you to mix speed data from different sources on the same screen. Having 2 TXT lines after each other will also rearrange the positioning.

Note: The EML 224 Compact needs one screen which indicates just the primary data. This screen is fixed and cannot be adjusted.

The non-active parameters will continue showing the dimmed title data, when not selected.
SETUP OF INPUTS AND OUTPUTS
The system will allow many NMEA formats to be displayed. Version 1.02 of the software allows the following:

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMVBW</td>
<td>Speed long, trans, forward water speed</td>
</tr>
<tr>
<td>VMMTW</td>
<td>Temperature (water)</td>
</tr>
<tr>
<td>VMVLW</td>
<td>Trip/Total (distance sailed)</td>
</tr>
<tr>
<td>VMVHW</td>
<td>Speed through water (resultant)</td>
</tr>
<tr>
<td>DIAG</td>
<td>Diagnostic output (all others deactivated)</td>
</tr>
</tbody>
</table>

The system will automatically update recognised formats. If the user wishes to output NMEA, the user can select the NMEA sub menu in the SETUP menu and move to the different formats using the up (↑) and down (↓) buttons. Each format can be activated/deactivated using the SET button.

AVERAGING
Each speed log type has some filters to ensure stable and correct data. The averaging filter takes a number of measurement pulses and makes a rolling average of these values. The longer the averaging, the more stable the data, however the slower the system will respond to changes. The EML 224 Compact has a minimum value of 15 pulses, which equates to 10 seconds. If the system seems unstable at times, increasing the average time will reduce the fluctuations. However, the filtering is time based and as it increases, the response time of the system will decrease.

CHANGING THE BAUD RATE
The NMEA 0183 (IEC61162-1) standard is 4800 baud. Some vessels run with higher baud rates. 4800, 9600, 19200, 38400, 57600, 115200 baud rates can be selected in the baud page of the setup menu. This page contains two sub menus, one for the sensor and one for the NMEA port. It is recommended that the sensor is kept to 4800, as this speed is robust with longer cables. To switch between sub pages, the SET button is used. The baud rates become active as you leave the baud page.
DEMO MODE
A demo mode is available, and can be activated in the diagnostics menu. Two modes are available:

**Mode 1:** is a dynamic demo mode taking the present value as the start point and slowly varying all the available values.

**Mode 2:** is a static demo mode taking the present values and keeping them active. To get the static mode (mode 2) to show a value other than zero, set the unit in mode 1 until the required value is displayed, and then change to mode 2.

When the demo mode is active, alarms will be disabled, and the screen will indicate the demo state with a blinking S in the upper right corner. The user can turn off the demo mode from the demo screen by pressing the down button (↓) until OFF is shown in the screen, or the demo mode will also turn off automatically after 10 hours.

**Note:** If the EML sensor is connected, it will overwrite the demo values. To prevent this, remove the white +24V wire to the sensor in the JB60 cabinet.

CHAPTER 3
CALIBRATION

THE PRINCIPLES
Calibration of a speed log involves finding the mounting angle of the sensor (heading offset) and the speed error, at various speeds. If the vessel has a laminar water flow near the sensor, a single calibration point will be sufficient. If the flow changes with speed, (due to the friction of the hull, or nearby constructions) then extra calibration points will be required. The sensor is mounted on a pole that can be turned to adjust the angle. This may result in a small angular error. This can be calibrated away in the 2 axis version. This should be done before the main calibration procedure is performed.

Full calibration is designed to ignore water current effects. The procedure requires the vessel to sail a fixed length track, at a constant speed. To remove the current and wind effects, the same track should then be sailed in the opposite direction. The average of these tracks will be used to calculate the speed difference between the real speed (measured using the actual distance and the time it took), and the measured speed (using distance from the sensor and the time it took). This procedure must be performed at least once, and then other speeds checked with the GPS.

If necessary, the procedure should be repeated at different speeds. SKIPPER recommend that calibration is performed at a low speed and a high speed. If the user is not able to turn the vessel and is sure there is no current, the calibration procedure can be stopped after the first leg and saved as a calibration point. This will give values that are correct for that particular condition. (If current is present, the speed through water will contain an error).
CALIBRATION MODES
The EML 224 Compact has two modes of calibration:
1. Manual
2. Semi-automatic.

Manual mode
The calibration – (MANUL) menu will allow the user to adjust the heading offset (*see note below), and the speed calibrations individually. Up (↑) and down (↓) adjust the highlighted parameter. SET moves to the next parameter. The data showing the result of the change will be displayed dimmed on the same screen (offset or speed). On the 3rd press, the lower value will change from Measured or Raw resultant value (Mrs) to Calibrated resultant (Crs) to allow the user to check the result of the change.

Procedure
When entering the manual mode, you will be presented with the offset value. This is the mounting angle of the sensor. The bottom line shows the measured offset at this moment. Adjust the middle value until the bottom value is near zero. Note the bottom value has a long average, and you may have to wait for up to a minute for the value to stabilise.

Note: This function is only available in twin axis systems.*
**Hint:** Pressing down (↓) and SET together will change the current selected value to the resultant value, or to zero, saving time when adjusting.

Pressing SET moves you to the next speed calibration. Enter the real (R) speed and measured (M) speed, (the measured speed can be seen on the bottom line). The calibrated value can be checked by pressing SET one more time. Repeat this process at as many different speeds as necessary.

### Semi-automatic mode

The calibration – AUTO menu will take the user step by step through the calibration menu. The user may follow the steps presented on screen. First drawing a line on the chart system, as shown in figure A & B.

- The line should be sailed at constant stable speed and the line should represent at least 5 minutes of sailing at the current speed.
- **Leg length setting.** (Adjust the length to match the line drawn on the chart).
- **Start first leg.** (The vessel crosses point A at the calibration speed, towards point B).
- **Stop first leg.** (The vessel reaches point B on the chart and turns to sail the line in the other direction).
- **Save first leg.** (If the presented speeds look correct, save the leg and continue).
- **Second leg option.** (If you do not have the possibility to turn the vessel, you can use the first leg data directly. If the first leg data is of poor quality you may not be given the option to continue).
- **Start second leg.** (The vessel crosses point B sailing towards point A, sailing at the same speed as leg 1).
- **Stop second leg.** (press as the vessel passes point B)
- **Calibration result and save option** (The user can decide to accept or reject this calibration, and in which memory position to save it).

**Note:** The user should press the start and stop based on position on the chart, and not sailed distance on the unit..

The user may decide which of the 10 calibration points the calibration will be saved in. The screen will display the first available position on the table, or overwrite from zero upwards.

**Note:** The single axis version (CD401E1) of this product does not have the
transversal axis available and will not require offset calibration. However, it is highly important that the unit is mounted pointing forward. If mounted in a valve, the pole can be rotated whilst moving the vessel against any current to maximize the longitudinal speed. This should be ahead.

**CHECKING THE CALIBRATION**

To check that the calibration points are not too far from the ideal linearity, the Calibration – GRAPH menu will plot the calibration points on the screen. The user may use up (↑) and down (↓) to select a calibration point and then adjust that value by pressing SET on the relevant point. The MENU button will return you to the GRAPH menu again.

Calibration should occur or be checked whenever the sensor is moved, or a new sensor is mounted. If there is growth on the sensor over time, the speed may be reduced slightly. The system should then be re-calibrated.

**Note:** If a new sensor is mounted, the calibration in the EML 224 Compact may be useable. However, it should be checked.
CHAPTER 4
ROUTINE OPERATION

RUNTIME SCREENS
The EML 224 Compact starts up in run mode. By pressing the MENU button, the preset user screens can be selected. (See diagram on page 32). Some of the menu screens (i.e alarms) are also available in the run mode.

The EML 224 Compact can be dimmed in any of the run screens using the up (↑) and down (↓) buttons.

If Trip/Total are selected as a displayed parameter, they can be toggled using the SET button.

ALARMS
The EML 224 Compact system contains one software alarm output and one reset alarm input.

- **Speed high** and **Speed low** alert the user when the vessel exceeds the speed limits.
- **Sensor alarm** is a system error alarm that activates if a serious system error occurs.
- **Fitness alarm** is a digital output, which if activated, sends a pulse each time a button is pressed on the display.
- **Power failure alarm.** If fitness alarm is deactivated, the output becomes a **Power failure alarm** which indicates a Power failure in the system. The output will show a high voltage at all times unless if there is a Power failure.

SETUP OF ALARMS
When operating as a primary source, the EML 224 Compact can be made to give an alarm in some conditions. These can be adjusted in the Alarms menu page. Values are changed with up (↑) and down (↓). The different alarm types can be selected by selecting from the menu, or by pressing SET to move to the next alarm.

When an alarm is activated, the alarm type will flash on the screen, and a signal will be sent to the external alarm system. The EML 224 Compact does not contain an internal alarm beeper. If required, an external alarm beeper can be wired to the alarm relay. Alarm protocol follows the IMO (International Maritime
Organization) regulations and OSV (Offshore Vessel) requirements and can be silenced remotely. To remove the alarm warning from the screen, a button must be pushed on the EML 224 Compact. According to newer regulations, the system should keep an alarm indication at all times if the system is measuring an alarm state.

If the vessel is sailing faster than the preset high speed, the message ‘SPDHI’ will flash until the external alarm reset is set. It will then show a constant inverted text SPDHI until the alarm is acknowledged on the EML 224 Compact display. If the vessel is still sailing fast, (over the alarm limit) the EML 224 Compact display will have a large square in the top right corner. This will only disappear when the vessel sails slower than the alarm speed again.

CHAPTER 5
CHECKING OUT YOUR SYSTEM

If you suspect something may be wrong with your EML system, the system has possibilities to perform self diagnostics. This is available in the diagnostics menu. In addition, an up to date diagnostics guide can be downloaded from the support pages of www.SKIPPER.no.

SELF DIAGNOSTICS
The EML 224 Compact contains some diagnostic features to enable the user to decide which part of the system is failing. The last 20 errors are stored in the system and can be downloaded using the diagnostics port. If the error is serious, the system will cause a general alarm (if activated), and restart itself. Error numbers can be found in Appendix 5.

<table>
<thead>
<tr>

</tr>
<tr>
<td>8 - loop</td>
<td>Test NMEA Baud 4800, 38400, 115200 (only passes if looped to the input).</td>
<td>Fail implies one of the speeds is not working correctly, (works only in test configuration).</td>
</tr>
<tr>
<td>9 - loop</td>
<td>Test Sensor Baud 4800, 38400, 115200 (only passes if looped to the input).</td>
<td>Fail implies one of the speeds is not working correctly.</td>
</tr>
</tbody>
</table>

Tests 5 - 9 are designed to be smart by sending and receiving information at the same time. They require loopback or the user to enter the expected reply. These tests are primarily for factory use.
TEST POINTS WITHIN THE SYSTEM

In addition to the internal system testing, it is also possible to connect a PC with a COM port to the 9 pin RS-232 "COMPACT" DSUB in the JB60CD unit box. By using hyperterminal, many additional features can be checked.

It is also possible to see what is happening within the system by observing the LEDs inside the JB60CD unit box. (See diagram on page 46-47).

Here you can check if the sensor is operational.

<table>
<thead>

<td>Red</td>
<td>Flashes with data arriving from the navigation systems.</td>
</tr>
</tbody>
</table>

**NOTE:** The LEDs will work even if the NMEA inputs are connected with the wrong polarity. In the correct configuration, they are typically on and flicker off.

LOGGING DATA

No internal data logging is available, however, a diagnostics NMEA can be logged on the standard NMEA port, or on the COMPACT plug in the Electronic unit (JB60CD).
Larger version in Appendix 2, page 46-47
CHAPTER 6
MAINTENANCE

ROUTINE MAINTENANCE
If the sensor begins to underestimate the vessels speed, there may be growth forming on the pins. These pins are made of a resistant, anti-rust metal. If the unit is powered off, or the vessel is stationary for longer periods of time (particularly in warm water), the growth may occur. This can be carefully removed by lifting the sensor if a valve is installed, or by divers or in dock. The pins must have electrical contact with the sea water, and MUST NOT be painted. The system may be unstable for up to 6 hours after the pins have been cleaned while a new oxide coat forms.

CHECKING YOUR VERSION
If the info screen is activated on the run screens, the system type and software version can be read from there. Otherwise the same screen can be obtained in the diagnostics menu. The system type will be one of the following:

<table>
<thead>
<tr>
<th>System Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CD E1</td>
<td>EML 124 Compact display 1 Axis</td>
</tr>
<tr>
<td>CD E2</td>
<td>EML 224 Compact display 2 Axis</td>
</tr>
<tr>
<td>CD LR</td>
<td>Log repeater compact display</td>
</tr>
<tr>
<td>CD MR</td>
<td>Multi repeater compact display</td>
</tr>
</tbody>
</table>

The system will be locked to one of these setups, but can be changed to one of the other systems (with an additional cost) using a code (see Appendix 5).

SOFTWARE UPGRADE
The system is undergoing continuously improvement, and periodically new software will be released. These can be found at the download area of the SKIPPER website (www.skipper.no) and may be downloaded and the system upgraded using a PC connected to the ‘Compact’ COM port in the Electronic unit (JB60CD). Alternatively a chip can be supplied (with an additional cost) with the new software. This is changed by removing the backplate of the display unit.

To upgrade the software, select which com port is to be used (for JB60CD electronic unit ‘Compact’ DSUB use ‘COMPACT’ port, and select SENSR for
upgrade). Ensure the line is clear by removing power from the EML sensor. Press set and restart the system. The unit will wait for new firmware for two minutes. After that it will start with the existing code.

![Image of a display showing Upgrade NMEA Now]

**MASTER RESET (FACTORY DEFAULT SETTINGS)**
The factory default settings can be restored by performing the following operations:
1. Select CODE in diagnostic (DIAG) menu.
2. Press the SET button (*Note*: Do not change code value, just press the SET button.)

The unit will now restart with factory default settings.

*Note*. On EML systems, this will also **reset** the stored calibration values.
APPENDIX 1

BACKGROUND INFORMATION

The EML 224 Compact system works using Kirchhoff's right hand rule (based upon Faraday's law of generators) which states that a conductor (sea water) moving through a magnetic field (generated in sensor) will produce a current orthogonal to both field and movement. So movement of the vessel through sea water with at least 5 ppt salinity will produce a current across the pins orthogonal to the ship's motion.
This minute current is measured and converted to a speed. This is formatted into proprietary NMEA VBW format and sent to the EML 224 Compact display which applies an angular correction for both transversal and longitudinal speed, and then a scaling factor is applied for the resultant speed.

Inside the EML224 smart sensor.

Calibration is piecewise linear, i.e. a linear line is plotted from calibration point to calibration point (sorted by size) and this linearity is applied to the incoming values. This can be seen on the graph screen.

Response of EML224

Callibration graph

5) EML 224 COMPACT MOUNTING DIAGRAM

Console mounting order:
A. Make a cut out in the Console (1) 125 x 125 (4.921 x 4.921)
B. Remove the mounting bracket (2)
C. Unscrew the 4 screws in the frame (3) (one in each corner) and remove the frame.
D. Put the Monitor (4) in the cut out and mark the 4 centerpoints for the BRK in the Console (1)
   (The drilling holes diam. depends on thickness and material in the Console.)
E. Use Pan head screws DN 7981 Dia. 2.9 (0.114). Length depends on the Console thickness.
F. Finally put on the frame (3). Make sure that the screw heads correspond with the cut outs in the frame.

In addition some propriety sentences are available. These can be obtained by turning on DIAG. (This disables all other NMEA outputs).
APPENDIX 4

SENDING THE SYSTEM FOR REPAIR

In the unlikely chance that a system fails, it may be necessary to send a part of the system back for repair. Make contact with your local dealer or SKIPPER for Returns Materials Authorisation number (RMA). (A list of service centres is available on www.skipper.no)

For normal service/support, please contact SKIPPER Electronics AS on e-mail: support@skipper.no, or contact our local dealer (list available on www.skipper.no).
APPENDIX 5

OTHER OPTIONS WITH THE COMPACT DISPLAY

EML 224 COMPACT OPTIONS

The EML 224 Compact display can be used in the following modes:

<table>
<thead>
<tr>
<th>Option</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log Repeater Compact CD401LR</td>
<td>A simple repeater for speed in 1 or 2 axis and trip. Limited functionality.</td>
<td></td>
</tr>
<tr>
<td>Multi Repeater Compact CD401MR</td>
<td>A comprehensive repeater for many of the common NMEA messages. Also functions for user defined messages.</td>
<td></td>
</tr>
<tr>
<td>Single axis EML 124 Compact CD401E1</td>
<td>With Electronic unit (JB60CD)</td>
<td></td>
</tr>
<tr>
<td>Dual axis EML 224 Compact CD401E2</td>
<td>With Electronic unit (JB60CD)</td>
<td></td>
</tr>
</tbody>
</table>

The software for all these options are stored in the system and the options can be changed using a security code. This code can be obtained from sales@skipper.no or by sending an order to SKIPPER together with the systems serial number. (Obtained by opening the code screen in diagnostics). On entering the supplied code number, the system options will be set. However, please note that the cabling is different for the repeaters and the main EML 224 Compact systems, so these are not compatible without replacing the back plate.

CHANGING THE SYSTEM/ ADDING OPTIONS

The EML 224 Compact is being developed as a low cost display alternative to full graphics displays already available. Most extra features are available for the EML 224 Compact and these can be activated using the CODE page in the setup menu. On this page, the systems unique ID is displayed. The new options can be purchased from the SKIPPER retailer to add extra functions. You will receive an activation code and, if necessary, a software upgrade.

Entering the code on the CODE page will activate/deactivate the option.

**NOTE:** It is important to note that option codes are unique for each individual unit and will not work on other units.
INTERFACING WITH YOUR DISPLAY

It is possible to retrieve configuration and diagnostic data from the Compact. This can be performed by connecting to the Electronic unit (JB60CD) 'compact' port, or directly through the NMEA port. In this way, error messages can be retrieved when required.

The following messages exist:

- \$PSKPVMPCGTER,x    if x = 0 = Last error, other = whole table
- \$PSKPVMPCDEMO,mm,lw,tl,tw,ta,lb,tb,ab,tmp,trip,total

where:
- mm=0, auto.
- mm=1, uses the following values: (see table showing mm=1 values)
- mm =2 , turn off.

<table>
<thead>
<tr>
<th>Table showing mm = 1 values</th>
</tr>
</thead>
<tbody>
<tr>
<td>lw</td>
</tr>
<tr>
<td>tw</td>
</tr>
<tr>
<td>ta</td>
</tr>
<tr>
<td>lb</td>
</tr>
<tr>
<td>tb</td>
</tr>
<tr>
<td>ab</td>
</tr>
<tr>
<td>tmp</td>
</tr>
<tr>
<td>trip</td>
</tr>
<tr>
<td>total</td>
</tr>
</tbody>
</table>

It may be necessary to remove other inputs on the same line (i.e remove power from the EML sensor).
ERROR MESSAGES

SYMPTOM: Screen shows error instead of data.
REASON: If no data is received from the sensor, the screen will show ‘ERROR’.
Fix: Check the LEDs are flashing in the Electronic unit. LD 100, LD 200.

- Connect a PC to the RS-232 Diagnostics Sensor/‘HEAD’ connector in the electronic unit. If the system is sending $PSKP.....ERRBOR or similar, the voltage to the sensor is too low.
- Check if the Voltage on J200 p1 p2 is 23-25 V.
- Check if the voltage in junction box is >21 V, if not twin pairs to get higher voltage. (Yellow/orange pair is not required and can be disconnected, and used to parallel the power).
- If no, or garbled data, check that the pairs are connected correctly (A/B).

If you suspect you have a problem within the CD401 unit, an error message table can be retrieved from the unit by sending the message $PSKPCCPPCERROR <CR><LF> from the ‘compact’ connector of the JB60CD or the NMEA input on repeater. The returned format is in the form: ID, number of errors, last error, first 18 errors.

$ PSKPERRORTABLE,19,32,100,<Error18>,…,<Error1>,
< Identifier >,<Number of errors(19)>,<Last Error after 18 errors(32)>,<first 18 error>,

This format shows a table of 20 numbers, where position 1 shows the number of errors stored. The errors are stored on the flash memory and will be retained. If you suspect an error, download the messages, then reset the error messages and try to perform the same error condition again. If successful, download the errors again and then check the list below. In addition the self test values 0-4 can be used to check the main peripherals of the unit.
<table>
<thead>
<tr>

APPENDIX 6
SUPPORT SOFTWARE & RELEASE NOTES

USING WINDOWS(TM) HYPERTERMINAL

Diagnostics can also be retrieved manually using hyperterm.

Sending commands in the diagnostics port, or along the NMEA input lines will result in an answer with the desired parameters. If other data is being sent on the line, it may be necessary to stop the other data, to allow the commands through uninterrupted.

Changes in this software v.1.02
1. Storage of screen setup fix
2. Fix in LR mode, startup problem.
